NEW YORK, NY, MAY 13, 2010 –msProjectExperts essential reference for Microsoft Project Server 2010 begins shipping June 14, in step with the general availability launch of the Microsoft Office 2010 suite. “We are pleased to announce the pre-sale availability of our most popular book in our series for Microsoft Project Server 2010 and Microsoft Project 2010,” commented Gary Chefetz, Microsoft Project MVP and the book’s primary author. “My co-authors Dale Howard, Tony Zink and I are very excited to be first to market with Project Server 2010 guidance, especially considering the importance of this release,” he continued.

Project Server 2010 is a landmark release of Microsoft’s market-leading project and portfolio management software. “This is the one I’ve been waiting for,” remarked Chefetz. “This release fulfills the potential I saw in this software when I first started using it as a PMO Director in

2000, when Microsoft first released Project Central. Project Server 2010 connects enterprise project management, enterprise portfolio management, resource management and business intelligence in an unprecedented package through the marriage of Microsoft’s project management and SharePoint 2010 technologies.”

Implementing and Administering Microsoft Project Server 2010 covers all aspects of Project Server deployment, from installation through configuration, and includes non-technical topics such as preparing an organization for an enterprise project management deployment and providing techniques for organizational change management. “Time and again we see organizations master the technical challenges of deploying an enterprise project management tool, but fail to plan for the organizational challenges, which very often prove to be the most difficult,” Chefetz said. “We tackle this right up front in *Implementing and Administering Microsoft Project Server 2010*, and follow this guidance with best-practice considerations throughout the book.”

At 912 pages, *Implementing and Administering Microsoft Project Server 2010* includes extensive SharePoint Server 2010 management guidance and a strong introduction to configuring and managing Microsoft’s business intelligence stack, including Excel Services and PerformancePoint Services. “We show you how to get

started with SharePoint Server 2010 workflows, how to build and deliver Excel reports and how to build dashboards for your Project Server 2010 implementation,” commented Chefetz.
